The PCB designers need the information about the electronic components in order to automatically place it. But the electronic components could be in different place on the artwork file. In those cases, each of the component has to be hand placed on the artwork file by the designer. It's time-consuming and costly. Pick and place utility can solve this problem. It's easy to use by designing a PCB with any software. It can save designer a lot of time. Pick and Place Utility is a lightweight application designed to extract the coordinates of all the electronic components from a SuperPCB artwork file. This information is required by the PCB manufacturers in order to automatically place the components. The program opens the PCB design and export all the coordinates to a text file that be viewed or changed with a simple text editor. - Edit coordinates using the built-in text editor - Export the edited coordinates to a text file - Export the project files as STL DC Motor RPM Calculator is a simple program designed to calculate how fast or slow a DC motor will rotate in various conditions. Includes a table for gear ratios and a table for the power curve of a DC motor. Motor Base The application provides basic functions to calculate the total speed of a motor for the given number of steps and for the given number of revolution; calculates the number of revolution and the number of steps for the given speed; calculates the voltage and the current for the given voltage and for the given current; calculates the winding resistance of an inverter; calculates the magnetic field generated by a coil and the number of turns; calculates the percentage of braking torque and the curve of the percent. Some of the core features of the DC Motor RPM Calculator application are as follows: Main Window Number of revolution - The number of revolutions of the motor is a required parameter to calculate the total speed of the motor. Number of steps - The number of steps and revolution of the motor are required parameters to calculate the total speed of the motor. Speed - The speed of the motor is the required parameter to calculate the total speed of the motor. Rating / RPM - The rating of the motor is a required parameter to calculate the total speed of the motor. DC Motor Specifications The Application provides a tab for DC Motor specifications which is used for calculating the following parameters for DC Motors: The application also provides a tab for calculating the resistance of a coil, resistance of a winding, the current of the coil and the voltage of the winding. With the help of the above tab, one can calculate the following parameters of a winding: Composite motor - The composite motor is a combination of the three phases of a DC motor that are in an arrangement of being placed in a circle. The composite motor is one that has three phases of winding called the bipolar winding. Precision motor - The precision motor is another type of motor which is usually used in applications that require very high speed and accuracy. The three phases of this motor are also arranged in a circle but it is not in a perfect one. The three phases are connected in series, or the three phases are connected in parallel. Intermediate motor - The intermediate motor is the type of motor that has three phases of winding but has only
